STATE SUPPORT FOR THE DIGITALIZATION OF SMES IN EUROPEAN COUNTRIES

Abstract

COVID-19 and Russia's war against Ukraine have created many challenges for the business models of SMEs, stimulating them to develop alternative forms of business. Among the key alternatives, one should single out digitization. However, imperfections of Ukraine's state support system for digital transformation necessitate adapting the positive practice of leading countries with excellent business digitalization. Therefore, this paper structures the practical experience of state support of European countries in the digitalization of SMEs. The study conducts a cluster analysis to identify countries whose experience in state support for business digitalization is the best for adoption. Clustering employed the criterion of using key digitization instruments: internet of things, integration of business processes into electronic processes, digital integration with customers/suppliers, cloud services, big data analysis, and artificial intelligence. Thus, 4 clusters were identified (the first cluster comprises 16 countries, the second – 2, the third – 5, and the fourth – 7). These findings contributed to the selection of some key measures. They included: expanding the financial capabilities of SMEs to adopt digital technologies in their processes; formation of digital hard skills among entrepreneurs and increasing the personnel potential of SME digitization; creation of a favorable business environment to stimulate the digital activity of SMEs; and popularization of business digitalization strategy as a component of digital transformation strategy in society.

INTRODUCTION

SMEs are an essential element of countries' national economies in the world, contributing significantly to their development (49.7% – in the total number of employees, 60% – in the created added value, and 50% – in the volume of exports). However, the recent changes in the business environment (e.g., the transition to Industry 4.0, the economic downturn due to COVID-19, and the Russian war against Ukraine) caused many challenges for the business models of SMEs. Thus, since the beginning of the COVID-19 pandemic, every fourth SME entity in EU countries is on the verge of bankruptcy; 26% of young and 18% of experienced SMEs went bankrupt during the year. The situation is worsening due to the shock from inflation and rising energy prices caused by Russian aggression. The need to adapt to changing conditions and maintain competitiveness stimulates SMEs to develop alternative business forms and diversify their offers and markets.

Business digitalization is considered a key to achieving success in the long term. It involves implementing digital technologies that can improve the ability of SMEs to collect, combine, process, and use business data. The digitization of SME business processes can help retain and increase the number of consumers, increase competitiveness, and save on operating and transaction costs.

However, the existence of both internal problems in the development of digital processes of SMEs and those related to the imperfection of the system of state support for the digital transformation forces to adopt the best positive practice of EU countries. SMEs face significant digital innovation barriers because of their limited resources and opportunities compared to big enterprises. Working with digital technologies is significantly different from traditional ways of doing business. This requires modernization of the business model and additional state assistance. Teteriatnyk (2018), Strilets (2019), and Okoi et al. (2022) investigated the role of government in improving the productivity and growth of small businesses. Moreover, it was found that the government's involvement in supporting the digitalization of SMEs is necessary.

Therefore, the issue of structuring the practical experience of state support for business digitalization to identify those leading countries whose experience in forming a clear legal framework and adequate state support is possible for adopting in outsider countries is relevant and necessary.

1. LITERATURE REVIEW

Digitalization is fundamental for economic growth and job creation in modern conditions. Therefore, its development occupies a leading place in the Strategy "Europe 2021–2027". Furthermore, digitalization is a consistent unification of all sectors of the economy and adaptation of subjects to the new conditions of the digital economy (Parviainen et al., 2022).

Liu et al. (2011) described digitalization as integration of digital technologies and business processes into the digital economy. Bethlendi and Szócs (2022) considered it a transformation of products, processes, and organizational aspects. Matt et al. (2015) concluded that it involves transformations in organizational methods, roles, and offers due to the implementation of digital technologies. Finally, Vial (2019) noted that it is improving processes by transforming its properties using information, computing, and communication technologies. As a result, digitalization increases countries' economic security and ensures financial systems' stability (Shkolnyk et al., 2022).

Business digitalization is a critical component of digitalization in society. Currently, digital technologies have penetrated almost all aspects of human life and opened new opportunities for businesses (Simatupang & Widjaja, 2012). Digitalization not only helps to overcome the information asymmetry between businesses and investors (Pedchenko et al., 2018) but also stimulates the development of SMEs in other business aspects. For example, the digitalization of banking services (Pham et

al., 2022; Kuznyetsova et al., 2022), the insurance market (Polinkevych et al., 2021), and the chatbots (Jansom et al., 2022) became significantly more developed during the COVID-19 pandemic.

Generally, business digitalization describes how firms can improve their operations and generate value by transforming their business models (Samper et al., 2022). Parida et al. (2019) showed that digital technologies help innovate organizational models and offer opportunities for value creation in industrial ecosystems. Yu et al. (2022) noted that business digitalization models refer to continuous improvement. Here, information, computing, communication, and connection technologies are vital for an organization's restructuring.

Business digitalization is multifaceted, combining various tools with different goals and forcing the reconfiguration of strategic assets. Only some SMEs can adopt such transformations. The smaller the company is, the less likely it will adopt digital tools and the more likely it will limit the use of elementary services.

Business digitalization involves transformations of business models, services, goods, and structures (Hess et al., 2016; Heavin & Power, 2018). As a result, it accelerates the company's economic development, increases its productivity and performance, minimizes transaction costs, and opens ways to new markets (Williams, 2021). According to Natorina (2017), digital transformations are crucial to rational management decisions, including digitalizing operational processes, virtualiz-

ing employee effectiveness, and transactional productivity systems. As for the impact of digitalization of business on productivity, dynamic managers can harness the potential of new methods and encourage their adoption (Li et al., 2018).

Digitalization of business is also a driving force that contributes to its advancement. Its main advantages include saving time, increasing business productivity, automation of production and other internal company processes, and improving communications. Moreover, it offers cross-selling/up-selling opportunities, reaching a new level of customer service and encouraging them to purchase more products, introducing competitive opportunities due to improved customer experience and overall optimization. Finally, it contributes to increasing GDP per capita and reducing CO2 emissions (Melnyk et al., 2021). According to Reim et al. (2022), SMEs may overcome obstacles and obtain various benefits (e.g., hiring highly-qualified staff) via digital technologies adoption.

Business digitalization across industries has enabled the internet of things (IoT), cloud computing, big data analytics, and artificial intelligence. By employing these tools, firms can enhance their performance (Lia et al., 2022; Polyakov et al., 2021). Thus, business digitalization involves cyber-physical systems, 3D printing, robotics, big data, and the internet of things. Moreover, to achieve success, mobile tools and applications, social media, analytical tools and applications, platforms for communication and data sharing, as well as collaboration applications, are necessary.

To digitize their offers, modern companies should adopt digital tools. Ting et al. (2020) noted that artificial intelligence (AI), 5G wireless networks, machine learning (ML), and deep learning (DL), as well as blockchain systems, contributed to a unique and beneficial environment in all sectors of the economy.

Almost a third of companies invest up to 50 million US dollars in the automation and digitization of business processes (Pereira et al., 2022). Thus, Maglakelidze and Erkomaishvili (2021) found that one of the alternative tools to overcome the challenges of the pandemic, which has given impetus to changes in business behavior, is to increase the

volume of sales through digital channels. It is argued that business activities have become more favorable during the pandemic through digital channels. Therefore, governments should provide support programs (tax incentives and subsidies) for SMEs.

Sestino et al. (2020) explored big data and the internet of things as tools for business digitalization strategies. The study asserted that these technologies can increase the competitiveness of companies. Furthermore, IoT offers possibilities to analyze consumer attitudes, behavior, and intentions.

Lestari et al. (2021) highlighted the role of e-commerce for small businesses in improving their operations. The results showed that non-implementation of e-commerce resulted in lower revenues for small businesses than those that adopted e-commerce. They concluded that e-commerce could benefit both governments and small businesses in times of crisis, e.g., COVID-19.

Another essential tool of business digitalization – digital platforms – was thoroughly researched by Oro (2018), Li et al. (2021), and Akhter et al. (2022). They found that digital platforms positively impact SMEs' business innovations and reconfiguration capabilities. An intelligent digital platform that brings together innovative stakeholders (e.g., government, academia, companies, and community) enhances cooperation between various actors interested in sharing information and promoting and selling the results of SME activity (Maquera et al., 2022). According to Cenamor et al. (2019), a digital platform supports information sharing and enables companies to unify and update their data.

However, more than applying digital technologies is needed to stimulate business digitalization. The development of all business digitalization tools deserves the government's close attention and determines the need for financial, informational, advisory, and other types of support. Small and medium-sized businesses should possess the necessary digital strategies, capabilities, and culture and talent growth initiatives to achieve digital transformation successfully. Many studies are focused on the elements of a successful digital business strategy and the role of government support

(Matt et al., 2015; Fischer et al., 2020). SMEs need a stakeholder collaboration strategy to adopt and develop digitization practices (Nudurupati et al., 2022). Due to the significant investments needed, it could be challenging for SMEs to adopt digital technologies. Thus, governmental support is crucial here (Yuan et al., 2021).

Governments support SMEs in adopting various digital platforms. However, the spread of such platforms depends on the structural and political aspects of countries and regions. For example, OECD (2021a, 2021b), EC (2022), and GEM (2022) showed that the country's socio-economic and demographic features, population awareness of digital tools, concentration of platforms across sectors, and its structural aspects (freedom and the rule of law, product market regulation and digital services) affect the use of platforms in a country.

In response to COVID-19, countries introduced various initiatives to promote SMEs' digitization, including online platforms. However, no conceptual approach to studying state support for the digitalization of SMEs has been elaborated. In particular, there is a research gap in terms of the experience of using essential tools: online platforms, the internet of things, the integration of business processes into electronic processes; artificial intelligence; digital integration with customers/suppliers; 3D printing and robotics; big data analysis; cloud services, and others. In addition, there are scarce studies on how the improvement of sustainable competitiveness can describe the development of digitalization (Petkovski et al., 2022). Although the literature highlights numerous tools of digital innovations and their positive impact on the development of SMEs, the interdependence between the competencies of governments and digital innovations and the positive practices of using such dependence have been studied in a rather fragmentary manner.

The level of business digitization in countries is directly dependent on the favorable business environment created by the government for the digital transformation of society. Therefore, the purpose of this study is to structure the practical experience of state support in European countries in the field of digitalization of SMEs.

2. METHODOLOGY

The paper uses cluster analysis (for grouping countries into clusters according to the level of application of business digitization tools by SMEs). Clustering SMEs by the level of business digitalization is needed to identify countries with a favorable environment for the digital transformation of enterprises since these countries are characterized by adequate state support. The proposed sequence of cluster analysis involves the following stages:

- Stage 1: Analyzing analytical and statistical data and forming of a database for analysis;
- Stage 2: Forming a sample of the leading indicators for evaluating the digitization of SMEs;
- Stage 3: Studying modern trends of changes in the leading indicators (Appendix A);
- Stage 4: Selecting software for cluster analysis;
- Stage 5: Selecting cluster analysis criteria;
- Stage 6: Building a dendrogram to form the number of clusters;
- Stage 7: Determining the fullness of clusters;
- Stage 8: Providing key characteristics of clusters;
- Stage 9: Generalizing conclusions.

Descriptive characteristics of cluster analysis are given in Appendix B.

3. RESULTS

Digitalization plays a significant role in increasing the sustainability of SMEs. It offers opportunities to restructure industries and enhance business competition. Companies adopt new business models and create value propositions via digital technologies. Therefore, SMEs enhance their performance, i.e., increase effectiveness and reduce operational costs, increase revenues, obtain more practical knowledge and innovations, and im-

Source: EC (2022), OECD (2021a), GEM (2022).

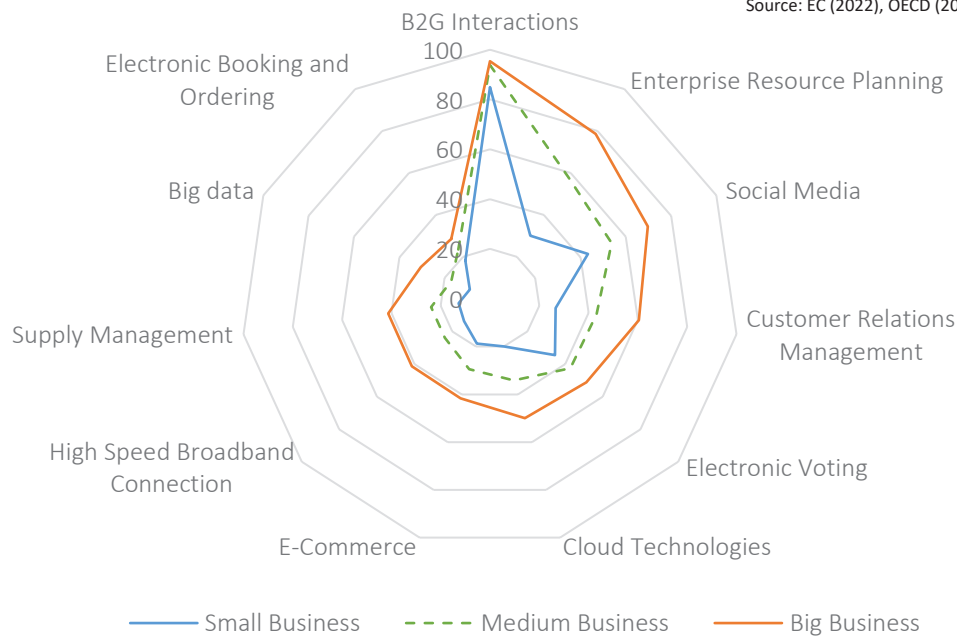

Figure 1. The use of digital technologies by business entities according to size in EU countries in 2020, %

prove customer engagement. Nevertheless, SMEs' digitization level is still deficient (Figure 1).

According to OECF calculations, other things being equal, the probability of closing an SME was approximately 10% higher than that of enterprises with a number of employees from 50 to 249. At the same time, SMEs in the field of wholesale and retail trade and hotel and catering establishments are particularly vulnerable to the consequences of the pandemic (OECD, 2021a). This evidence is consistent with the statement about the importance and necessity of government support for SMEs, especially regarding the digitization of their business processes. Therefore, the government should promote the competitiveness and productivity of SMEs, in particular, by encouraging the digitization of SME business processes.

In recent years, the digitalization of business has continued at a rapid pace. Across industries, business entities rapidly equip their employees with digital tools. However, smaller companies could be more successful in this sphere. There are also differences in implementing electronic business among countries (Figure 2).

Thus, studies on the integration of SMEs in digital technologies in foreign countries have shown that these processes take place most effectively in

Finland, Denmark, and Belgium. In these countries, the level of integration of SMEs in electronic business is more than 45%. On the other hand, the level of integration in Latvia, Malta, Austria, Luxembourg, Lithuania, and France is somewhat lower but still relatively high.

The European Union pays considerable attention to implementing digital technologies in business processes, defined primarily in the strategy "Europe 2021-2027". However, at the moment, the EU member states have an unequal use of digital tools. Therefore, in order to determine the most successful comprehensive approaches of the governments to stimulate business digitalization, it is proposed to cluster countries according to the level of implementation of all digitalization components. Moreover, it is vital to identify those "star countries" whose level of SME digitalization is the highest, and, therefore, their practices are the most successful (Table 1).

The descriptive characteristics of the cluster analysis (Appendix B) made it possible to determine a sufficient validity of clusters: there are 16 countries in cluster 1, 2 – in cluster 2, 5 – in cluster 3, and 7 – in cluster 4.

Therefore, the first cluster has relatively low (compared to other clusters) indicators of the use of

Stage 7: Determining the clusters	
Cluster 1	Austria, Belgium, Ireland, Spain, Cyprus, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Germany, Portugal, Slovakia, France, Croatia, Czech Republic
Cluster 2	Greece, Italy, Finland
Cluster 3	Denmark, Estonia, Norway, Slovenia, Sweden
Cluster 4	Bulgaria, Bosnia and Herzegovina, Poland, Romania, Serbia, Turkey, Hungary
Stage 8: Providing key characteristics of clusters	
Stage 9: Generalizing conclusions	

digital technologies, particularly in artificial intelligence, digital integration with customers and suppliers, and cloud services. However, it has an adequate level of big data analysis and the use of 3D printing and robotics. This cluster includes Austria, Belgium, Ireland, Spain, Cyprus, Latvia, Lithuania, Luxembourg, Malta, Netherlands,

Germany, Portugal, Slovakia, France, Croatia, and the Czech Republic.

The second cluster showed high use of internet of things and integration of business processes into electronic business; the highest level of digital integration with customers/suppliers; and the popu-

larization of cloud services. This cluster includes Greece, Italy, and Finland.

The third cluster is a leader in cloud services, big data analysis, and artificial intelligence. It sufficiently uses the internet of things and has an average level of digital integration with customers/suppliers. This cluster includes Denmark, Estonia, Norway, Slovenia, and Sweden.

The last (fourth) cluster is an outsider and has the lowest indicators for all the studied indicators, which indicates the lowest level of digitalization of SMEs in the countries of this group. This cluster includes Bulgaria, Bosnia and Herzegovina, Poland, Romania, Serbia, Turkey, and Hungary.

The results showed that the countries of the second and third clusters are examples to follow. In addition, it is appropriate to study the example of the first cluster regarding the use of big data analysis, 3D printing, and robotics. Thus, Table 2 summarizes the main measures implemented by the state bodies of the leading countries to stimulate the digitization of business.

Analysis of state support for digitization found that authorities have started to implement awareness-raising activities and policy actions regarding online platforms (Australia, Denmark, France, and the United Kingdom). In addition, various support initiatives stimulate SMEs to adopt online platforms, although the prevalence of online platforms differs due to structural and procedure causes (OECD, 2021a, 2019; EC, 2022). Among the latest trends, it is also worth highlighting financial support programs for the digitalization of SMEs (Norway, Switzerland, Greece, etc.) and advisory and informational support provided by the governments.

Table 2 shows that SMEs need appropriate policies and support programs from the government to successfully implement digital transformations. It is crucial to analyze the role of governmental support in increasing the harmonization of government policies and programs with SMEs' demands. Therefore, the development of a conceptual model of state support for the digitization of SMEs is necessary. This model should include main barriers and challenges of SMEs digitization, govern-

Table 2. State support measures for business digitalization

Source: OECD (2021a, 2019), EC (2022), GEM (2022).

Country	State support measures for business digitalization
Estonia	Implementation of the "Digitalization Grant" program. Providing financial support for digital technologies and robots and automation in the manufacturing and mining industries.
France	A public online platform for the cooperation of SMEs wishing to digitize their business with public and private consultants throughout the country. The ability to implement functions: creating a digital strategy, increasing the presence on the Internet, developing the clientele, selling on the internet, etc. Consultants provide information on available financing options; information channels to offer data on support initiatives from the government and private sector actors; a daily radio show that discussed future digital trends.
Denmark	The government's program "SMEs: Digital" is part of the National Government's Strategy for Digital Growth; the initiative "SME: Digital Features the E-Commerce Centre" is designed to help small and medium-sized enterprises with online sales, includes grants for private consultations to clarify and develop the potential of the company in the field of e-commerce; E-Commerce Center workshops where online selling challenges are discussed with industry experts.
Sweden	The Digi-Lift initiative promoted digital transformations with an emphasis on the industrial sector. It is part of the smart industry strategy.
Italy	Due to the pandemic, Italian regions offer financial support to companies and self-employed workers to work from home. Funding is provided to cover the cost of training and purchasing digital tools/subscriptions to digital platforms for remote work.
Slovenia	"Digital vouchers" program support micro-SMEs with up to 10000 euros to improve digital competences, prepare a digital strategy, ensure cyber security, and implement digital marketing.
Ireland	Implementation of Digital Trading Online Voucher. Micro-enterprises can receive a voucher for 2500 euros to develop online sales and access to free online training.
Luxembourg	A digital technology fund with co-financing from public and private actors and focusing on venture investments in startups working in the field of ICT and related industries, including cyber security, big data, digital health, next-generation media and communication networks, digital training, satellite telecommunications, and services.
Portugal	Opendays i4.0 is an information campaign to popularize the need for digital transformation among SMEs.
Germany	Go-digital is a program to support SMEs (up to 100 employees and a total balance sheet of up to 20 million euros) in IT security, digitization of business processes, and digital market development, thanks to the expertise provided by consulting firms.

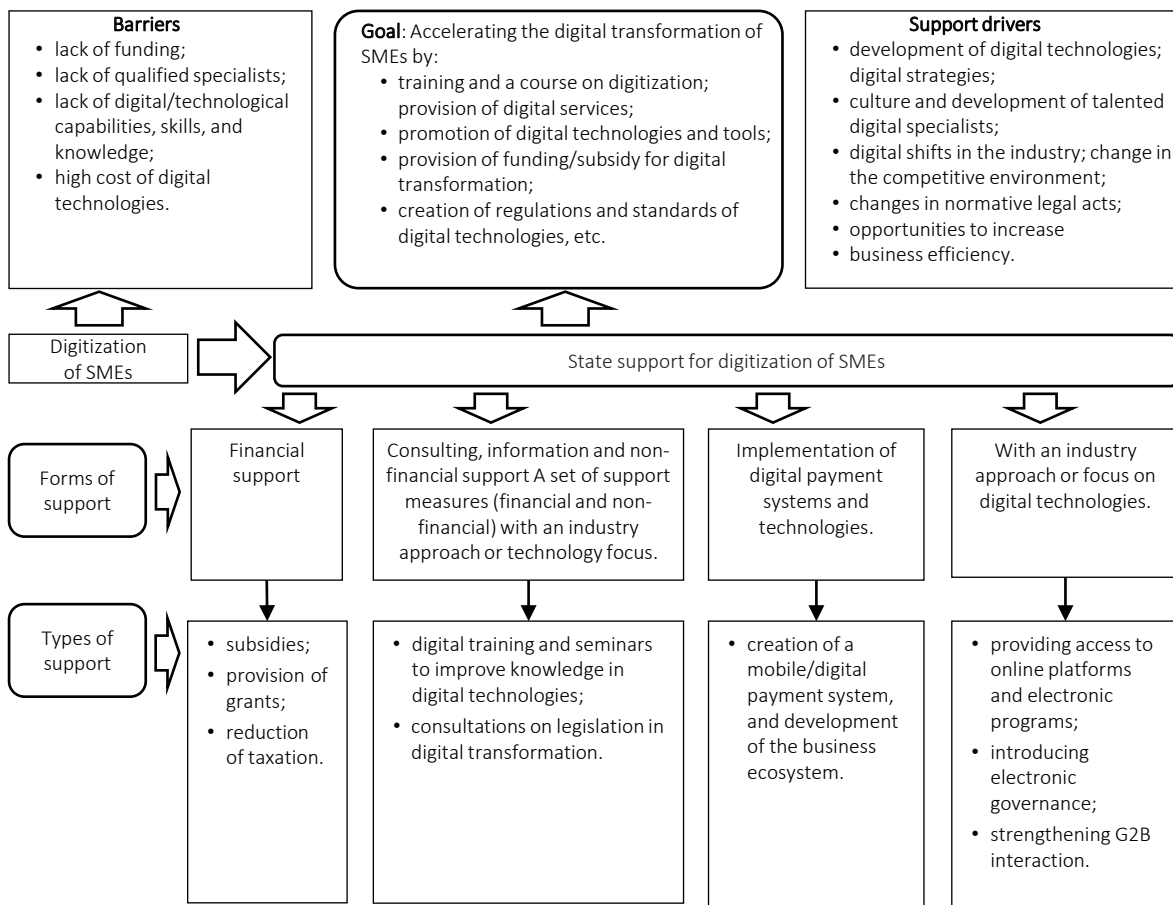

Figure 3. Conceptual model of state support for digitization of SMEs

mental functions in supporting the digitization of SMEs, drivers for stimulating the digitization of SMEs, and classification of existing types and forms of state support (Figure 3).

The heterogeneity of SME actions, the multiplicity of their business environments, and the urgent challenges facing them require a fundamental rethinking of state policy regarding SMEs and digitalization. A general government approach will be a key success factor, including effective multi-level governance mechanisms at the national and sub-national, regional, and urban levels, international learning, and enhanced monitoring and evaluation capacity.

The study of the positive practice of state support for the digitalization of SMEs in these countries contributed to the selection of a number of key forms of state support that will stimulate the digitalization of SMEs in the global economy (Figure 4). They are: financial support (fi-

nancing programs for the digitalization of SMEs following the example of Estonia, Slovenia, or Luxembourg); advisory and informational support (information campaigns for the promotion of digital technologies; seminars and trainings on digital competencies similar to Portugal and Germany), state online platforms (as practiced in France), and ensuring the operation of digital payment systems and technologies, which is envisaged by the strategy of the national government of Denmark. Accordingly, crucial steps on the way to stimulating business digitalization are: expanding the financial capabilities of SMEs to adopt digital technologies in their processes; formation of digital hard skills among entrepreneurs and, on this basis, increasing the personnel potential of digitization of SMEs; creation of a favorable business environment to stimulate the digital activity of SMEs; popularization of the strategy of digitalization of business as a component of the strategy of digital transformation of society (Figure 4).

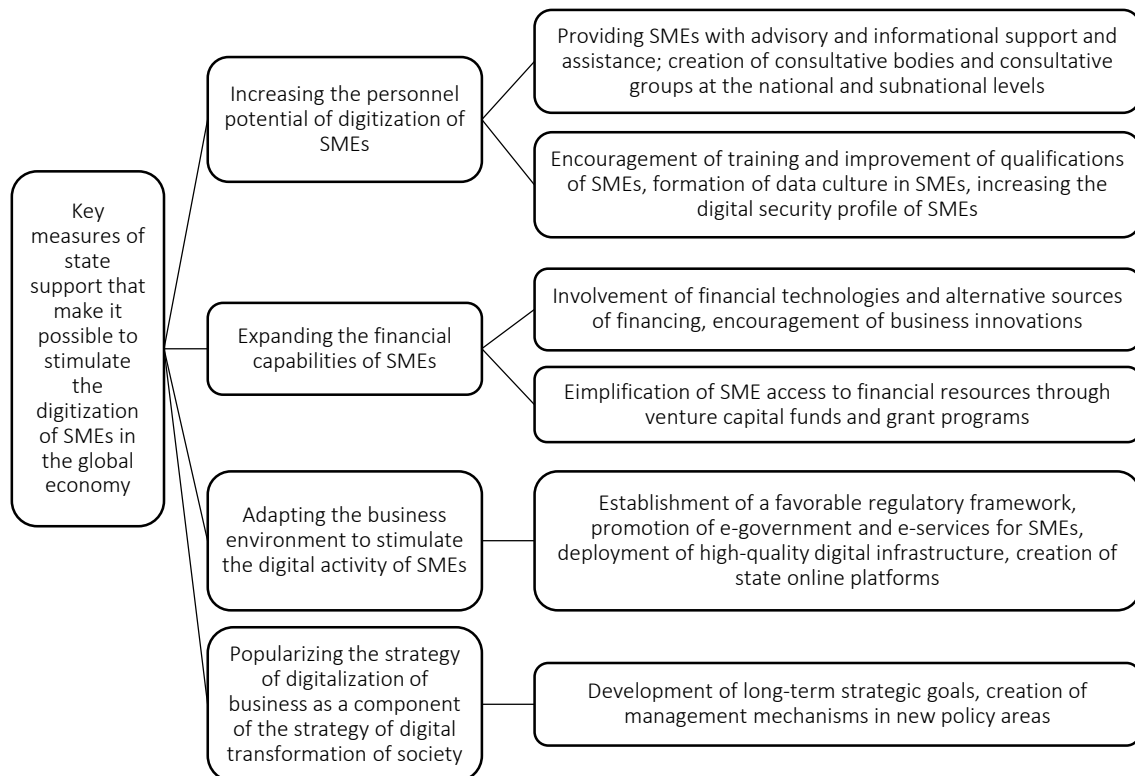

Figure 4. Key measures of state support to stimulate the digitalization of SMEs in the global economy

4. DISCUSSION

The previous literature noted the existing challenges of business digitalization (Lestari et al., 2021; Liu et al., 2011; Maglakelidze & Erkomaishvili, 2021), but the importance of government support for business digitalization, especially in countries with a low digital transformation rating, was not discussed in details. Scientists have identified business digitalization as a key tool for the development of SMEs in modern conditions (Cenamora et al., 2019; Guseva & Legominova, 2018; Li et al., 2018) and the importance of state support for business digitalization (Holotiuk & Beimborn, 2017; Hess et al., 2016; Lia et al., 2022). However, this was done at a very general level without specifying what the government support measures should be and how they can solve the existing digitization problems. There must be a variety of solutions for all countries as each country has a different level

of digital transformation. However, SMEs face the same problems when changing their business model in favor of digitalization. Therefore, it is important to provide small and medium-sized enterprises with government support to adopt digital technologies with limited resources (informational, financial, or personnel). Supporting Fishchuk et al. (2018), the state should assume several roles simultaneously for digital modernization and transformation. They include: leader and experimenter (attraction of innovative SMEs and IT companies to carry out digital transformation of state bodies and enterprises; integration of services of private companies into their processes through online platforms, etc.); regulator and defender (normative and legal regulation (in particular, standardization), training and retraining of personnel, as well as ensuring access to capital, etc.); and popularizer (increasing competence in data science, artificial intelligence, and digital transformation).

CONCLUSION

A study of the process of digital transformation in many countries showed that the pace of digitization of small and medium-sized businesses is lower than that of big ones. The literature review proved their

greatest vulnerability to the challenges of the pandemic, the Ukrainian-Russian war, and shocks from rising energy prices. The paper substantiates the necessity of using digital technologies as an alternative to business development in overcoming negative consequences. The results found that the level of digitization of business in countries is directly dependent on the favorable business environment created by the government for the digital transformation of society. In order to determine the countries whose experience in state support of business digitalization is the best for adoption, clustering was carried out according to the criterion of using crucial digitalization tools by SMEs in these countries.

The results made it possible to highlight a number of countries whose experience is sufficiently practical and, therefore, worthy of attention in terms of adoption in countries striving for digital development. The key positions of the state support strategies for SME digitalization in these countries became the basis for the formation of a conceptual model of state support for SME digitalization. It includes the following key components: the goal of SME digitalization; digitization drivers; barriers and challenges of digitization; types and forms of state support for digitization. In addition, the study of the experience of digitally active countries made it possible to outline the strategic prospects of digital business transformation for countries with a low level of digitization. They are: expanding the financial capabilities of SMEs to adopt digital technologies; formation of digital hard skills among entrepreneurs and, on this basis, increasing the personnel potential of digitization; creation of a favorable business environment to stimulate the digital activity of SMEs; and popularization of the strategy of business digitalization as a component of the digital transformation strategy of society.

APPENDIX A

Table A1. Initial data for the cluster analysis of countries by the level of SME digitization

Source: Authors' elaboration.

Country	Internet of things	Integration of business processes into electronic processes	Artificial intelligence	Digital integration with customers/ suppliers, supply chain management	3D printers and robotics	Big data analysis	Cloud services
Austria	48	44	7	19	3	5	37
Belgium	25	56	8	21	5	19	49
Bulgaria	14	21	3	9	1	5	10
Bosnia and Herzegovina	13	25	2	11	3	3	6
Greece	21	34	4	8	2		20
Denmark	17	49	20	55	8	21	62
Estonia	16	22	2	61	2	7	55
Ireland	31	23	6	16	2	20	56
Spain	26	48	6	32	5	5	27
Italy	31	31	5	95	4	6	59
Cyprus	32	33	2	12	5	2	48
Latvia	25	38	5	12	2	5	25
Lithuania	24	43	3	25	3	8	29
Luxembourg	20	38	12	12	3	15	29
Malta	24	38	8	21	8	25	53
Netherlands	18	41	10	22	5	23	62
Germany	34	36	9	15	6	15	38
Norway	22	38	9	63	3	16	61
Poland	15	30	2	11	2	6	24
Portugal	20	51	16	16	4	9	31
Romania	9	16	1	15	1	4	13
Serbia	15	21	0	19	1	1	25
Slovakia	24	30	4	14	3	4	33
Slovenia	46	34	9	57	3	4	39
Turkey	20	27	2	19	3	5	8
Hungary	20	19	3	12	3	5	23
Finland	39	47	12	81	6	17	71
France	20	44	5	21	3	18	26
Croatia	21	22	8	39	3	11	36
Czech Republic	28	35	3	9	4	7	42
Sweden	38	33	8	43	5	11	73

APPENDIX B

Table B1. Initial centers of clusters

Indicators	Cluster			
	1	2	3	4
D1	48	31	17	9
D2	44	31	49	16
D3	7	5	20	1
D4	19	95	55	15
D5	3	4	8	1
D6	5	6	21	4
D7	37	59	62	13

Note: Created in IBM SPSS Statistics.

Table B2. Chronology of iterations

Iteration	Change of cluster centers			
	1	2	3	4
1	22.134	9.626	19.202	8.431
2	1.302	3.209	3.200	1.054
3	.077	1.070	.533	.132
4	.005	.357	.089	.016
5	.000	.119	.015	.002
6	1.559E-5	.040	.002	.000
7	9.170E-7	.013	.000	3.216E-5
8	5.394E-8	.004	6.859E-5	4.020E-6
9	3.173E-9	.001	1.143E-5	5.025E-7
10	1.866E-10	.000	1.905E-6	6.281E-8

Note: Created in IBM SPSS Statistics. a: Iterations are terminated because the maximum number of iterations has been completed. Iterations did not lead to convergence. The maximum change of the absolute coordinate for any center: .000. The current iteration is 10. The minimum distance between the initial centers: 50.941.

Table B3. Belonging of countries to clusters

Observation number	Country	Cluster	Distance
1	Austria	1	23,517
2	Belgium	1	21,408
3	Bulgaria	4	7,781
4	Bosnia and Herzegovina	4	10,541
5	Greece	2	15,85
6	Denmark	3	23,043
7	Estonia	3	20,860
8	Ireland	1	25,413
9	Spain	1	21,001
10	Italy	2	14,439
11	Cyprus	1	18,057
12	Latvia	1	17,315
13	Lithuania	1	13,654
14	Luxembourg	1	14,901
15	Malta	1	19,951
16	Netherlands	1	27,412
17	Germany	1	10,133
18	Norway	3	11,034
19	Poland	4	11,618
20	Portugal	1	18,696
21	Romania	4	9,635
22	Serbia	4	11,581
23	Slovakia	1	14,652
24	Slovenia	3	27,527
25	Turkey	4	11,357
26	Hungary	4	9,927
27	Finland	2	14,440
28	France	1	16,615
29	Croatia	1	26,719
30	Czech Republic	1	13,045
31	Sweden	3	22,396

Note: Created in IBM SPSS Statistics.

Table B4. End centers of clusters

Factor	Cluster			
	1	2	3	4
D1 Internet of things	26	35	28	15
D2 Integration of business processes into electronic processes	39	39	35	23
D3 Artificial intelligence	7	9	10	2
D4 Digital integration with customers/suppliers	19	88	56	14
D5 3D printing and robotics	4	5	4	2
D6 Big data analysis	12	12	12	4
D7 Cloud services	39	65	58	16

Note: Created in IBM SPSS Statistics.

Table B5. Distance between the end centers of clusters

Clusters	1	2	3	4
1		74,227	41,654	32,267
2	74,227		33,971	93,426
3	41,654	33,971		63,332
4	32,267	93,426	63,332	

Note: Created in IBM SPSS Statistics.

Table B6. Number of observations in each cluster

Cluster	1	16,000
	2	2,000
	3	5,000
	4	7,000
Valid		30,000
Missed		1,000

Note: Created in IBM SPSS Statistics.

Table B7. Distance of ANOVA clusters

Indicators	Cluster		error		F	Significance
	Average square	Degrees of freedom	Average square	Degrees of freedom		
D1	312.281	3	64.256	26	4.860	.008
D2	434.713	3	73.893	26	5.883	.003
D3	70.037	3	15.329	26	4.569	.011
D4	4581.129	3	52.768	26	86.816	.000
D5	8.722	3	2.646	26	3.296	.036
D6	106.924	3	41.657	26	2.567	.076
D7	2328.838	3	120.006	26	19.406	.000

Note: Created in IBM SPSS Statistics. F-criterion should be used only for description purposes, since the clusters are selected so that the difference between observations in different clusters is maximal. The observed significance levels are not adjusted for this and, therefore, cannot be used to test the hypothesis of equality of cluster means.
